Losing an item on campus is easy — getting it back is not

Campus lost-and-found runs on notice boards and chat groups. There is no single place to report, search or match items, so many belongings are never recovered.

WHY THIS PROJECT MATTERS

1

Scattered reports

Information is spread over notice boards, WhatsApp groups and word of mouth.

2

Slow, manual search

Students must browse every post themselves and can easily miss a match.

3

No trust or insight

Claims rest on conversation alone, and nobody sees where items get lost.

How it is handled today, and where it falls short

CURRENT PRACTICE

- Physical notice boards and counters
- Informal WhatsApp and social media groups
- Manual comparison of reports by memory
- Users keep checking back for updates

GAPS WE SEE

- No central, searchable record
- No automatic matching of lost and found items
- No location tracking or analytics
- No ownership verification
- No notifications

One campus platform to report, match and recover

A web application where students and staff log lost or found items and the system helps connect them.

1 Report items

Log lost or found items with category, description, location, date and photo.

2 Match smartly

A rule-based engine suggests likely matches with a confidence score.

3 Track locations

A campus map shows where items are most often lost.

4 Verify and notify

Private ownership checks and email alerts when a match appears.

What we aim to achieve

OBJECTIVES

- 1 Create one central record of lost and found items
- 2 Automate matching to cut manual searching
- 3 Show location hotspots across campus
- 4 Protect ownership through private verification
- 5 Alert users as soon as a match appears

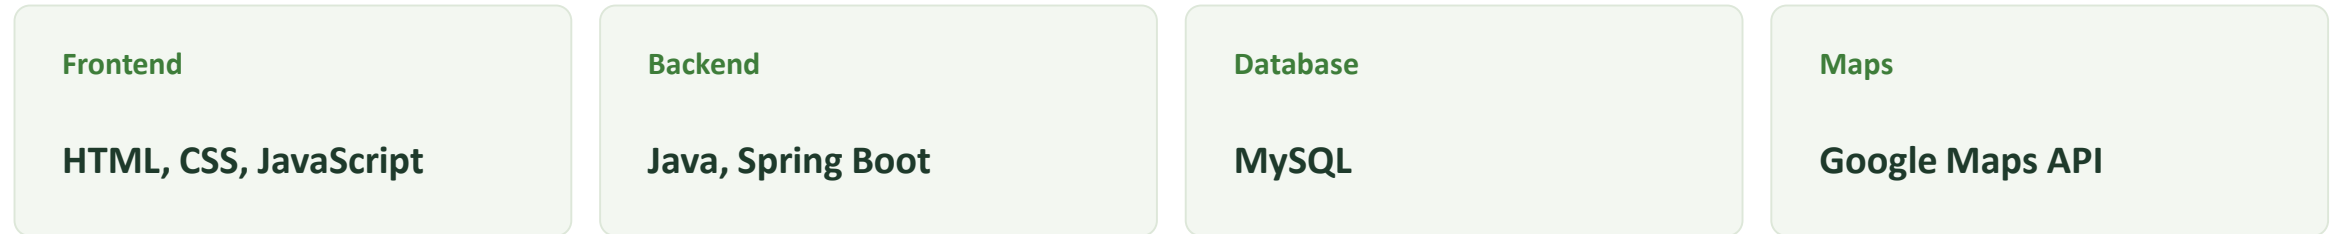

EXPECTED OUTCOME

Faster recovery

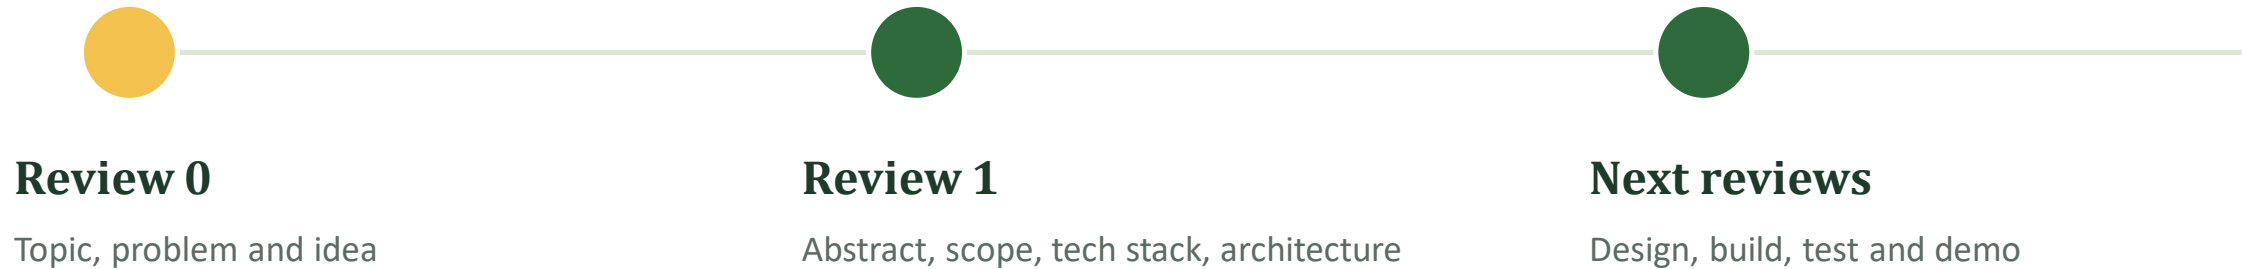

A working web system where a lost item can be reported, matched, verified and marked recovered, with less effort and fewer disputes.

How we plan to build it
